EXPERIMENT - 5

Reports, Dashboard and a Simple Custom Page in Zoho Creator

Loan Application & Pre-Screening Management

Application Name	Loan Application & Pre-Screening Management
Form Name	Loan_Application_Form
Report Name	Loan_Application_Report
Student Name	DAKSHESH N
Student Roll No.	241401017
Experiment	5
Platform	Zoho Creator

Lab Record
Present submitted loan enquiries in a report, summarize them with a simple dashboard, and provide an applicant guide through one custom page.

Department of Computer Science and Engineering

Rajalakshmi Engineering College

1. Objective and Design

To make submitted applications easy to review using Loan_Application_Report, a compact dashboard and a simple help page. The report supports human pre-screening and document verification.

Component	Purpose / implementation
Loan_Application_Report	Existing report retained; display name corrected. Review applicant, loan type, employment and monthly income; filter to relevant applications.
Total Applications	Count of all form records: 7 at capture time.
Applications by Loan Type	Pie chart grouped by Loan_Type using its non-empty field count.
Applications by Employment Type	Pie chart: Salaried 6; Self-Employed 1.
Recent Applications	Existing embedded report retained, with latest records first.
Loan_Application_Help	One static custom page with six short guide panels.

2. Procedure

1. Open the existing report and retain its link name. Set its visible name to Loan_Application_Report. Verify that mock submissions are listed.

2. Use a temporary Applicant Name contains Mock filter for the evidence view. This displays only the three test records.

3. Retain the existing dashboard, correct its labels and add the Employment Type chart. Keep existing summary cards and the embedded report.

4. Create Loan_Application_Help with short instructions for form completion, validation, submission and officer review.

5. Open the live dashboard and help page to verify their displayed content.

Data interpretation: the dashboard includes four preserved older records and three new mocks. One older record has a blank Loan Type, so the loan-type field count totals 6 while Total Applications is 7. No old record was altered to force the counts to match.

3. Report Evidence

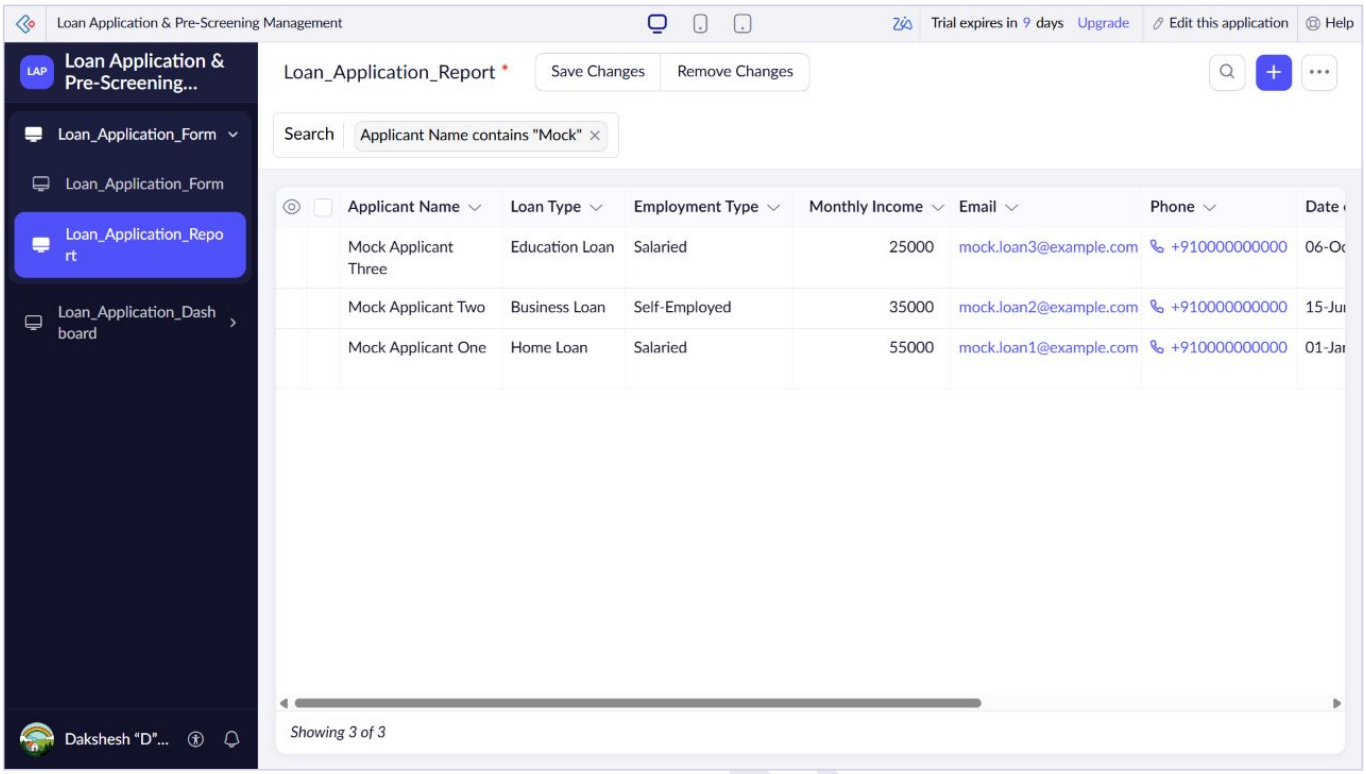

Figure 5.1 - Current report displaying all three fictional records through a temporary filter.

Report Review Procedure

1. Locate a submitted record by applicant name or loan type.

2. Compare the recorded employment and monthly income with the enquiry purpose. Use report filters for manual pre-screening.

3. Review the selected application details and preferred callback time before requesting document verification. No loan is automatically approved.

The screenshot proves that three mock submissions reached the report. The search is an evidence-view filter; it does not remove the four earlier records or redefine the underlying report data.

4. Dashboard Summary Evidence

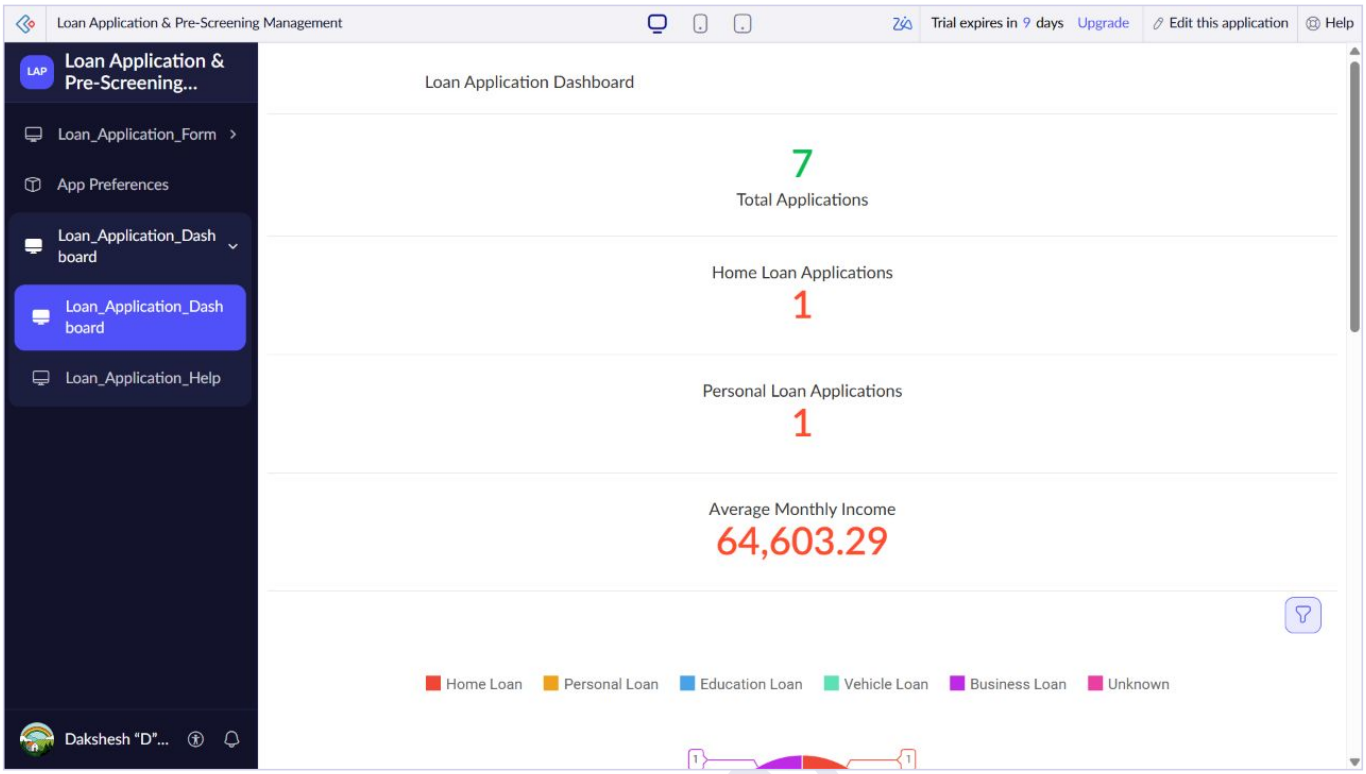

Figure 5.2 - Existing dashboard cards after label correction; Total Applications is 7.

Visible card	Value at capture	Interpretation
Total Applications	7	All existing and mock records.
Home Loan Applications	1	Records classified as Home Loan.
Personal Loan Applications	1	Records classified as Personal Loan.
Average Monthly Income	64,603.29	Aggregate of the current records, including legacy data.

The Home Loan, Personal Loan and average-income cards were already present and were retained. No elaborate dashboard or additional data source was introduced.

5. Chart Evidence

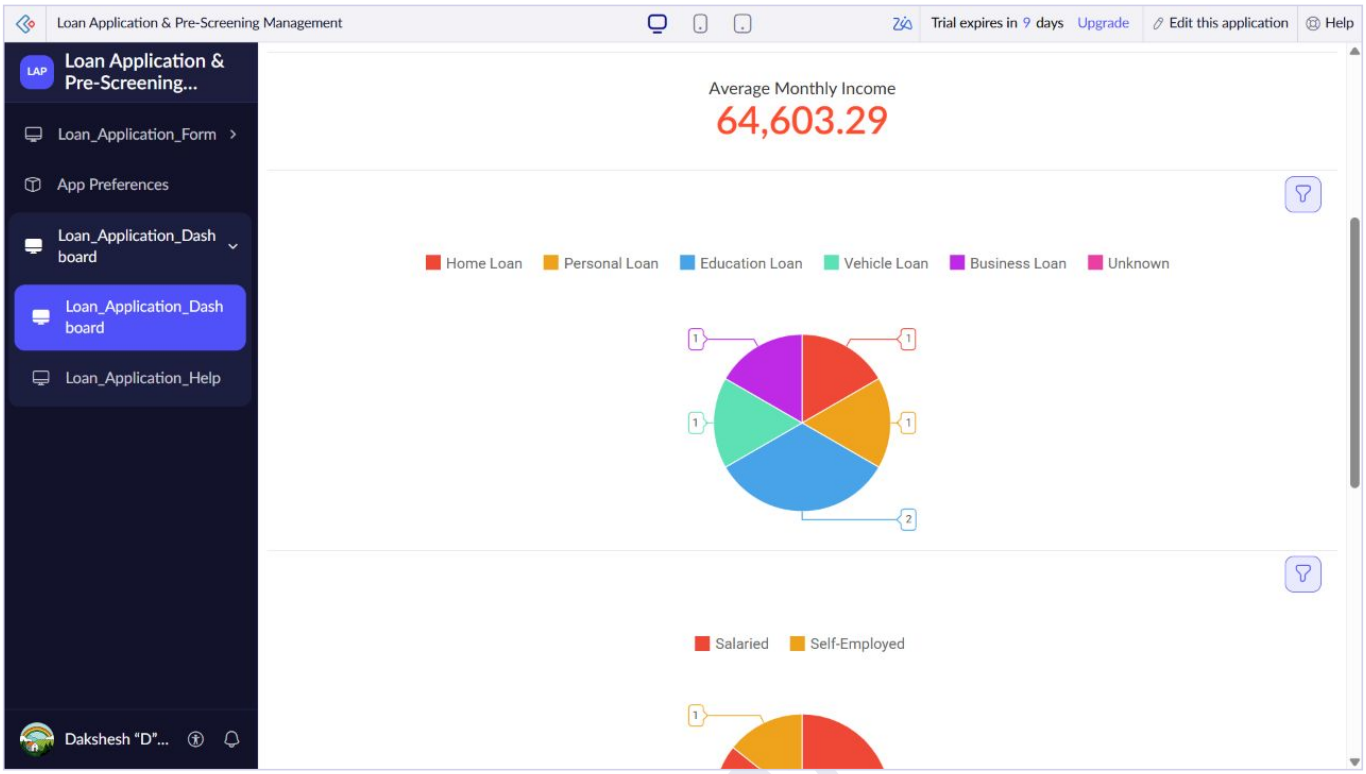

Figure 5.3 - Applications grouped by Loan Type in the existing dashboard.

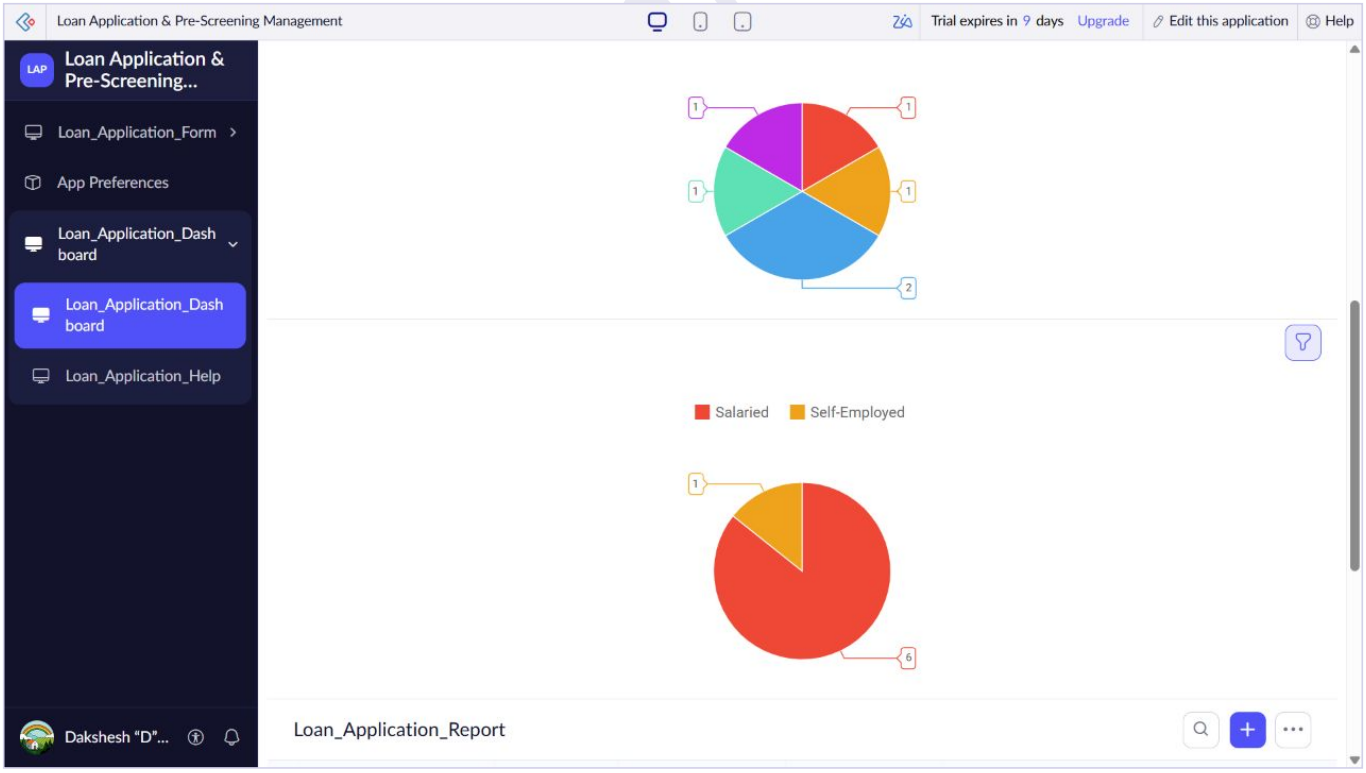

Figure 5.4 - Added Employment Type chart: Salaried 6 and Self-Employed 1.

6. Custom Page, Verification and Result

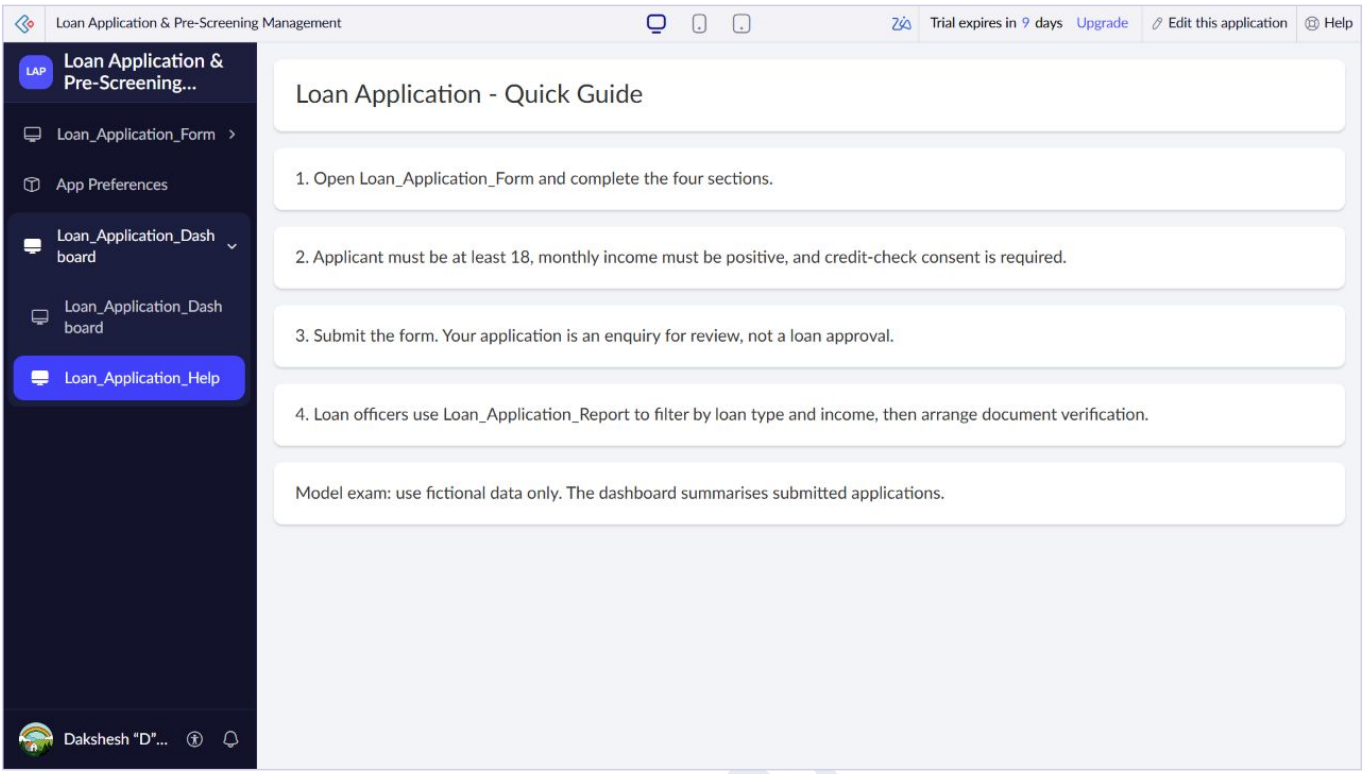

Figure 5.5 - Loan_Application_Help: a simple six-panel guide in the live application.

Check	Result
Report contains the new samples	Passed: three mock rows visible.
Dashboard cards and charts render	Passed: totals and category charts displayed.
Custom page opens	Passed: guide panels visible.
Public publishing	Not performed; authenticated application access retained.

Result: The existing report and dashboard were reused, labels were corrected, an employment chart was added, and one simple custom page was created. The pages provide a clear model-exam demonstration of reporting, aggregation and user guidance.

Learning outcomes: distinguish records from aggregates, explain the effect of blank values on field counts, use report filters and create a minimal custom page.
