EXPERIMENT 10

PERFORMANCE OPTIMIZATION

Student Name: Dakshesh N **Roll Number:** 241401017

1. Aim

To review the performance and usability of the existing Loan Application & Pre-Screening Management application in Zoho Creator and identify safe optimization practices.

2. Objectives

• Inspect the existing form, report, and dashboard components.
• Review report layout and visible columns for unnecessary information.
• Understand safe report-level optimization without deleting fields or records.
• Distinguish observed interface evidence from performance measurements that were not collected.

3. Software and Application Details

Platform: Zoho Creator
Application: Loan Application & Pre-Screening Management
Form: Loan_Application_Form
Report: Loan_Application_Report
Dashboard: Loan_Application_Dashboard

4. Theory

Performance optimization improves responsiveness and usability while preserving correct behavior. In low-code applications, potential review areas include report columns, filters, record volume, dashboard loading, and workflow execution. Reducing unnecessary columns can make a report easier to read, but it does not automatically prove faster loading. Before-and-after timing should be recorded if a measurable performance claim is required.

5. Procedure

1. Opened the existing Zoho Creator application in the editor.
2. Inspected the visible navigation for the loan application form, report, and dashboard.
3. Selected the loan application report as the first component to review for unnecessary columns and report usability.
4. Followed a report-focused optimization approach and avoided deleting fields or records or changing workflow logic.
5. Reviewed the available interface evidence and documented the limits of the test.

6. Observations

Component	Evidence / observation	Measurement status
Loan application form	The screenshot shows Loan_Application_Form open in the app editor.	No form load time recorded.
Loan application report	Loan_Application_Report is visible in the app navigation.	Column count and load time not recorded.
Dashboard	Loan_Application_Dashboard is visible in the app navigation.	Dashboard load time not recorded.
Optimization outcome	Report-focused inspection was the chosen optimization step. The exact change made was not specified in the conversation.	No numerical speed improvement can be claimed.

7. Result

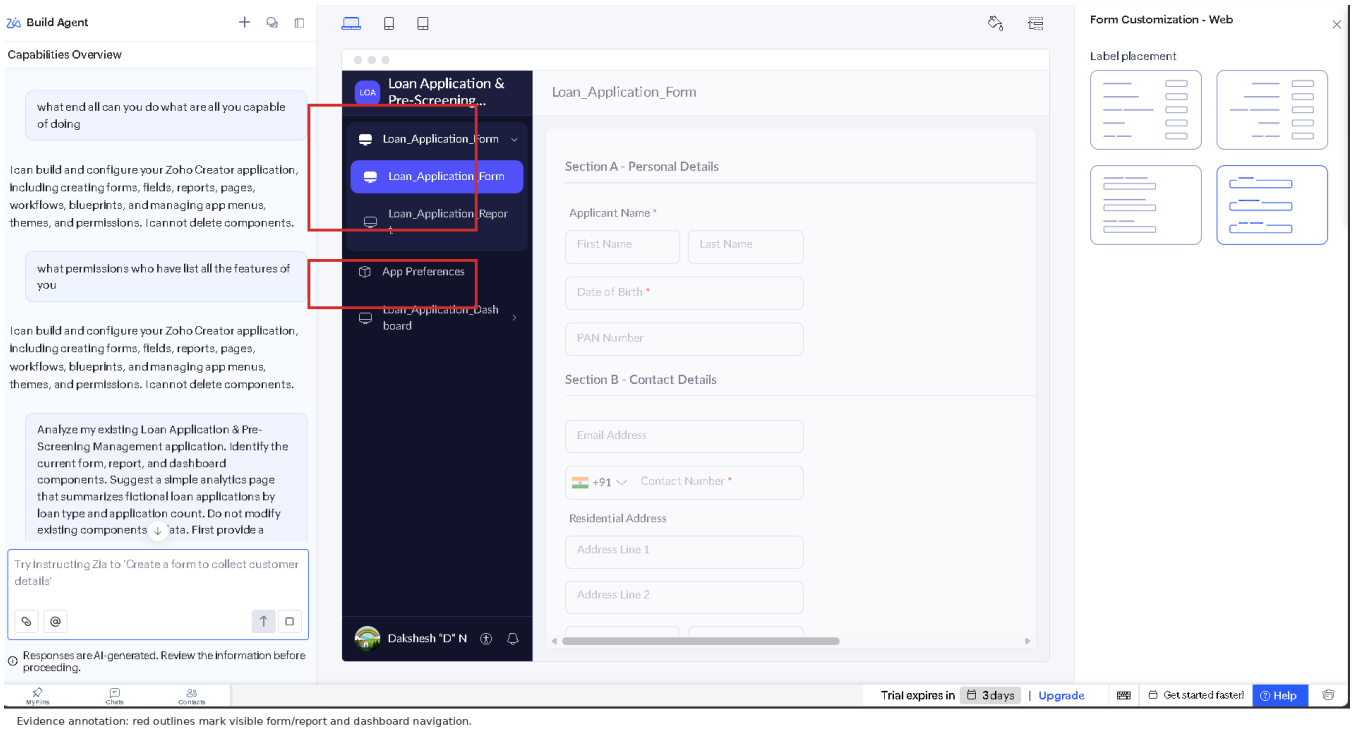

The existing application editor shows the loan application form, report, and dashboard in its navigation. The report was selected as the focus for a safe usability/performance review. Because no before-and-after loading times or exact configuration change were supplied, a quantitative performance improvement is not asserted.

8. Conclusion

The experiment reviewed the structure of the existing Zoho Creator application and identified report layout as a low-risk starting point for optimization. The supplied screenshot provides evidence of the existing app components, but it does not by itself prove a speed improvement. A future test can measure the same report before and after a specific change under similar conditions.

9. Evidence

Figure 10.1 is based on the screenshot provided during the lab conversation. The red outlines are added annotations to identify the visible report and dashboard navigation; the underlying screenshot is not presented as a performance benchmark.

Evidence annotation: red outlines mark visible form/report and dashboard navigation.

Figure 10.1 — Existing Zoho Creator app editor showing Loan_Application_Form, Loan_Application_Report, and Loan_Application_Dashboard navigation.

Evidence limitation: The screenshot confirms the visible app structure only. It does not show report data, loading-time measurements, or a before-and-after optimization result. Do not describe it as proof of a measured performance gain.
