EXPERIMENT 11

DEVELOPMENT-TO-PRODUCTION DEPLOYMENT

Student Name: Dakshesh N **Roll Number:** 241401017

1. Aim

To study a controlled deployment lifecycle for a Zoho Creator application, including validation, release preparation, and post-deployment checks.

2. Objectives

• Understand development, testing, and production stages.
• Prepare a deployment checklist for the existing loan application.
• Identify risks involving workflows, permissions, integrations, and data.
• Document what must be verified after release.

3. Platform and Application Context

Platform: Zoho Creator
Application: Loan Application & Pre-Screening Management
Form: Loan_Application_Form
Report: Loan_Application_Report
Student Roll No.: 241401017

4. Theory

Deployment moves a tested application configuration from a development environment to a target environment. A controlled release requires checking component compatibility, connections, permissions, test data, and rollback/backup options. A publish or deployment action should only be performed when the target environment and authorization are confirmed.

5. Procedure

1. Review the existing application components: form, report, dashboard, workflows, and permissions.
2. List the components and dependencies that would need validation before release.
3. Prepare fictional test cases for valid submission, invalid input, report display, dashboard display, and permission boundaries.
4. Use the platform's supported deployment/publish process only if a designated target environment and authorization are available.
5. After any approved release, perform smoke tests and record the actual outcome; retain a backup or rollback plan.

6. Observations / Test Results

Area	Observation	Status / limitation
Release target	No target environment or actual release was identified in the supplied conversation.	Deployment not claimed as completed.
Pre-release validation	Recommended tests documented for form, report, dashboard, workflows, and roles.	Live test results need to be filled after execution.
Rollback readiness	Backup/rollback should be confirmed before release.	Not verified in this report.

7. Result

The deployment lifecycle and verification checklist were documented. No production deployment or successful release is claimed because a target environment and release result were not provided.

8. Conclusion

A safe deployment should only follow validation and authorization. The schematic represents the recommended lifecycle; it is not evidence that the application was deployed.

Suggested smoke-test checklist

■ Valid fictional application submits successfully
■ Invalid required fields are blocked
■ Report opens and displays expected records
■ Dashboard loads and visualizations correspond to report data
■ Each role sees only authorized functions and records
■ Integrations are configured for the target environment
■ Backup/rollback plan is known

9. Evidence

The figure below is a generated explanatory schematic based on the documented experiment context. It is clearly labeled illustrative and is not a captured screenshot of a live deployment or a claim that untested actions succeeded.

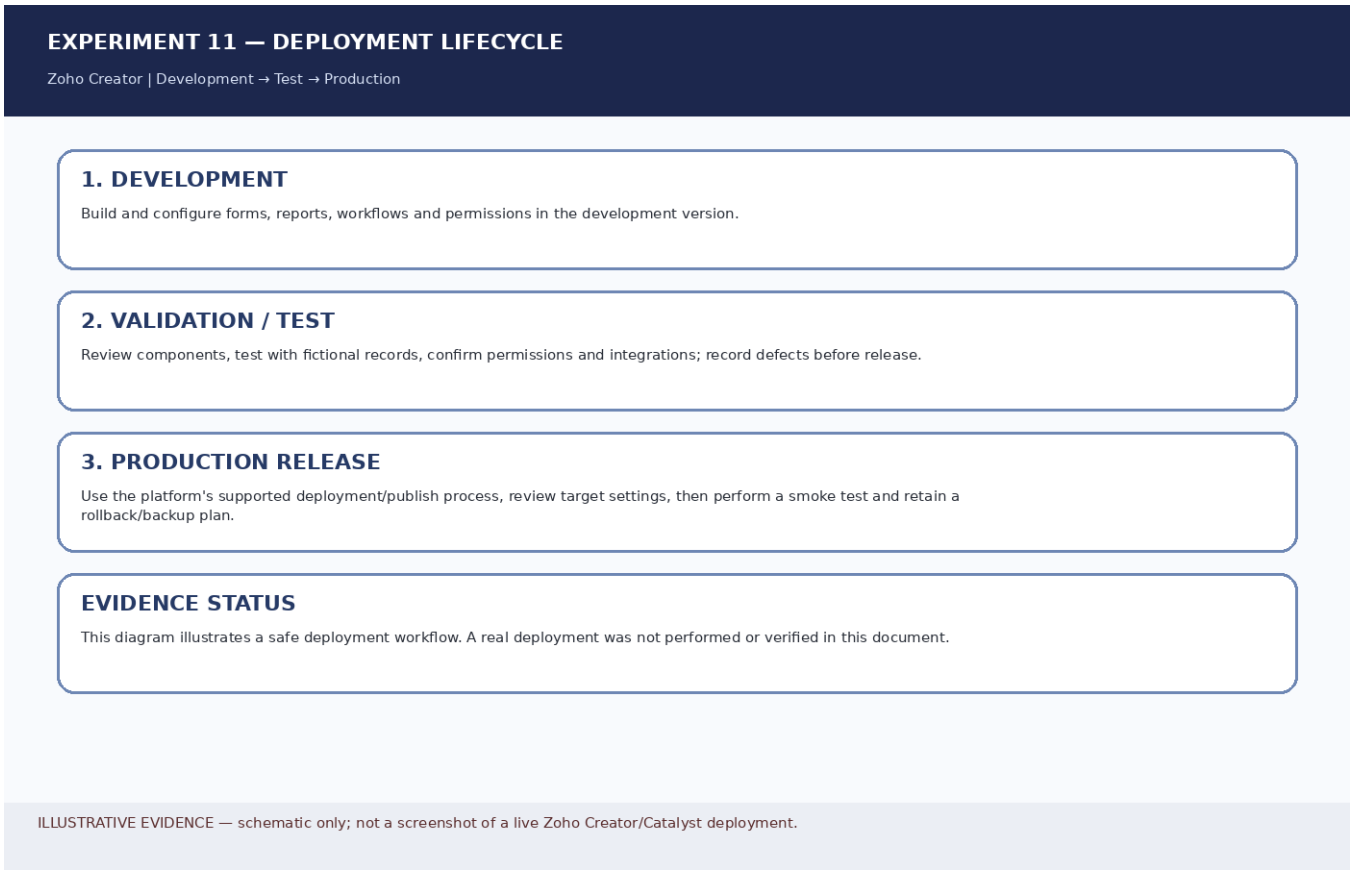

Figure 11.1 — Illustrative deployment lifecycle (development → validation → production).

Submission note: Where the experiment requires live configuration evidence, replace or supplement this schematic with your own screenshot from Zoho Creator/Catalyst after completing the corresponding step. Do not submit the schematic as a real system screenshot.
